

Creamos 2 instancias de amazon una ClienteDNS y otra ServidorDND con bind9 instalado

Con el comando dig vemos la información de google a través de la ip privada del servidor (hacemos esto desde el cliente)

Editamos este archivo en el servidor, editamos estas 3 lineas y poniendo el 8.8.8.8 y luego reiniciamos el servicio

```
ubuntu@ip-172-31-24-52:/etc/bind$ sudo vim named.conf.options
```

```
options {
    directory "/var/cache/bind";

    // If there is a firewall between you and nameservers you want
    // to talk to, you may need to fix the firewall to allow multiple
    // ports to talk.  See http://www.kb.cert.org/vuls/id/800113

    // If your ISP provided one or more IP addresses for stable
    // nameservers, you probably want to use them as forwarders.
    // Uncomment the following block, and insert the addresses replacing
    // the all-0's placeholder.

    forwarders {
        8.8.8.8;
    };

    //=====
    // If BIND logs error messages about the root key being expired,
    // you will need to update your keys.  See https://www.isc.org/bind-keys
    //=====
    dnssec-validation auto;

    listen-on-v6 { any; };
};
```

```
ubuntu@ip-172-31-24-52:/etc/bind$ sudo service bind9 restart
ubuntu@ip-172-31-24-52:/etc/bind$ service bind9 status
